Resolving UI Update Issues Using CloudFront Invalidation

Issue: After deploying updated frontend code to the S3 bucket, developers reported seeing the older UI instead of the new version. This issue arises due to caching by the CloudFront distribution.

Objective: Ensure that the latest UI changes are reflected by creating an invalidation for the CloudFront distribution.

Steps Taken:

1. **Analyzed the Issue:**
   - Confirmed that the new frontend code was successfully built and deployed to the S3 bucket. (Checked in jenkins)
   - Verified that the older UI was being served due to CloudFront caching.
2. **Solution: CloudFront Invalidation:**
   - Accessed the AWS Management Console.
   - Navigated to the CloudFront distribution associated with the S3 bucket.

   - Created an invalidation for the updated assets using the following steps:
     - Selected the distribution.
     - Clicked on the "Invalidations" tab.
     - Clicked "Create Invalidation."
     - Specified the invalidation paths (e.g., `/*` to invalidate all cached content).

     - Confirmed the invalidation request.
3. **Validated the Changes:**

- Waited for the invalidation process to complete.
- Confirmed with the developers that the new UI was now visible and the issue was resolved.

Outcome: The UI update issue was successfully resolved by creating a CloudFront invalidation, ensuring the new frontend code was served to users.
